

- Main features:

- Added a form that can send information to the backend, and from the backend to the firebase

- Add-product.component.ts
- Add-product.component.html
- Add-product.component.cs

(these 3 are in the store file in app)

- Product.services.ts
- app-routing.module.ts
- app.module.ts

These work, aside from some issues that were worked on in office hours
