- Main features:
  - I enabled authentication service, and Added authentication on a new page for an email and password with firebase authentication. The messages to the user based on what they input are found in the inspect console, which show errors or messages depending on what you input
    - Auth.component.ts
    - Auth.component.html
    - Auth.service.ts
    - authResponse.ts
    - App.module.ts
    - app-routing.module.ts
- Bonus:
  - The password is blocked out for security
  - The login button is hidden until a realistic email is input and a password of at least 8 characters is input as well
  - The form automatically clears when you input something and submit
